CUSTOMER

V1.0

Know Every Device.
Eliminate Exposure.

1. Acronis

To be actioned ahead of your ThreatAware install session

Note: You must be a **Management Portal Administrator** to create API clients. The API client inherits access rights from the user who creates it — ensure the creating account has sufficient permissions for the required scopes. The client remains valid even if the creating user is later removed from Acronis Cloud.

a. Generate API Key

- Login to the Acronis Management Portal
- Navigate to **Settings > API Clients** and click **Create API Client**
- Enter a name (e.g. ThreatAware) — the client will be created with **Active** status by default
- Assign the following scopes:
 - urn:acronis.com::agent_manager::agent_viewer
 - urn:acronis.com::agent_manager::admin
- Click **Create**
- Copy and save the **Client ID** and **Client Secret** immediately — the Client Secret is only shown once and cannot be retrieved again. If lost, it must be reset in the Management Console, which will invalidate all existing tokens

b. Datacenter URL

- Your Datacenter URL is visible in the browser address bar when logged into the Management Portal — for example <https://eu2-cloud.acronis.com>
- Copy the base URL without any trailing path

c. Required Details

- Datacenter URL
- Client ID
- Client Secret
